

December 13, 2017

It's clear! Our patience has been rewarded with good conditions so we can go to work: the temperature will range between -19°C and -23°C , the wind is gentle, between 7 and 10 knots. Compared to yesterday, these weather conditions should be seen as an invitation to explore.

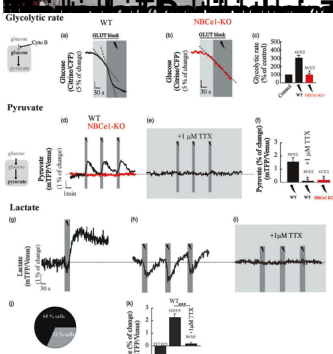

We planned an intense day to make the most of this opportunity In the morning we measured

beacons installed in previous years, they displayed an accumulation of 40 cm of snow during the year. In the afternoon, and after adjusting the snowmobile radar, we were able to measure for 8 continuous hours, covering an area of 80 km near the southern tip of the Sub-glacial CECs Lake. The whole operation concluded at around 11 p.m. Back in our mobile station, we had a big dinner and went to sleep exhausted.

December 12, 2017

Today we woke up to face the fury of the white continent. The weather conditions are extreme; very strong continuous winds, heavy snow with minimal visibility. For safety reasons, this white wind made it completely inadvisable to go and take the planned measurements. We decided to stay in the comfort of our mobile station analyzing data and resting. We'll have to wait until tomorrow to see if our luck improves.

Antarctic Expedition 2017
